and Breast Tumor Localization

CLINICAL CASE REVIEW: Long term SCOUT[®] Placement in Breast and Axillary Node Prior to Neoadjuvant Chemotherapy

Patient: 64-year-old female /

Diagnosis: Locally advanced Invasive Ductal Carcinoma, Left UOQ with Left Axillary Metastasis

Rx: SCOUT localization of the left breast and left axillary lymph node was performed prior to neoadjuvant chemotherapy.

Challenge: Surgery delayed for 516 days post SCOUT localization.

Conclusion: SCOUT localization in the breast and axillary lymph node lesions can be performed prior to neoadjuvant chemotherapy when the lesion(s) are well visualized. FDA-cleared long-term placement in the breast and axillary lymph node soft tissues allowed for 516-day interval between time of SCOUT localization and definitive breast surgery in order to accommodate the patient's concomitant health care needs.
